

Reddit announcement — v2.0

Below are ready-to-paste posts for r/BambuLab, r/3Dprinting, and r/prusa3d.
Attach **docs/v2_showcase.png** (or the individual screenshots) as the image.

Title options (pick one)

- **[Free tool] I made a desktop app that turns any image into a 3D-print filament palette — now with a slot planner + filament preview (v2.0)**
 - **My free “image → real filament colors” matcher got a big v2.0: AMS/MMU3 slot planner, filament preview, TPU/Silk/Matte/Wood, and way better color accuracy**
 - **v2.0 of my free filament color-matcher: plan your AMS slots, preview the print in real filament colors, 225 filaments**
-

Body (r/BambuLab / r/3Dprinting)

A while back I shared a little desktop app that extracts the dominant colors from an image and matches them to **real filament colors** you can actually buy. Tons of great feedback — so here's **v2.0**, which is a pretty big upgrade:

What's new

- **Much better color accuracy** — matching now uses **CIEDE2000** (the modern perceptual color-difference standard) instead of the older CIE76. Blues, reds and near-neutrals match noticeably better.
-  **Print System Planner** — pick your setup (Bambu **AMS 4/8/16**, Prusa **MMU3**, **tool changer / multi-head**, **IDEX / dual**, or **manual swaps**) and it assigns each color to a slot, warns you if you have more colors than slots, and reminds you about purge/waste on shared-nozzle systems.
-  **Filament Preview** — re-renders your image using only the matched filament colors, so you can see roughly what the print will look like before you commit.
- **✚ Bigger database — 225 filaments across 7 materials.** Added real **TPU, Silk, Matte and Wood** lines (Bambu, Polymaker, Overture, SUNLU, eSun, ColorFabb) on top of the existing PLA/PETG/ABS.
-  **Direct color input** — no image? Just paste hex codes (or use the color picker) and match directly.

It also still shows a **cost estimate** for the print and **“Buy” links** for each matched filament, and exports to JSON/TXT/HTML.

 **Free, open source, cross-platform** (Windows / macOS / Linux). Windows folks can grab the one-click installer from the Releases page — no Python needed.

👉 **GitHub:** <https://github.com/Netspecs/3d-color-palette-matcher>

👉 **Download v2.0:** <https://github.com/Netspecs/3d-color-palette-matcher/releases/tag/v2.0>

Would love feedback — especially which **brands/materials** you'd like added next, and whether the slot planner matches how you actually plan multi-color prints. 🙏

Body variant (r/prusa3d — lead with MMU3)

Sharing a free, open-source desktop tool I built: it takes any image (or hex codes you type in) and matches the colors to **real filament colors you can buy**, then helps you plan a multi-color print.

v2.0 just landed and it now understands the **Prusa MMU3 (5 slots)** directly — the new **Print Planner** assigns each extracted color to a slot and flags when you have more colors than slots. Other highlights:

- **CIEDE2000** perceptual matching for much better accuracy
- **Filament Preview** — see your image rendered in the matched filament colors
- **225 filaments / 7 materials** (added TPU, Silk, Matte, Wood)
- Cost estimate + buy links + JSON/TXT/HTML export

Free, cross-platform, no account. Feedback very welcome!

Ready replies for common comments

- **“Does it work offline?”** → Yep, 100% offline. The filament database is bundled; the only time it touches the internet is if you click a “Buy” link.
 - **“Can you add ?”** → Please open an issue (or PR) on GitHub with the brand + color name + hex — the database is just a Python list, super easy to extend.
 - **“Colors look slightly off vs the real spool.”** → Filament color is an approximation (screen vs. real, lighting, translucency). The ΔE number next to each match tells you how close it is; lower = closer.
 - **“Mac/Linux build?”** → Both are built by CI on each release; check the Releases page.
-

Posting tips

- Best days/times for r/BambuLab & r/3Dprinting: weekday mornings (US).
- Lead with the **image** (v2_showcase.png) — visual posts do far better.
- Reply to early comments quickly; it boosts visibility.
- Flair: use **“Show and Tell”** / **“Free Tool”** / **“Software”** where available.
- Don't cross-post all subs the same minute; space them out a few hours.
